

MeetPlay

Meetings That Play Back

AI engagement for video calls that people actually stay awake for.

Live video

Live transcript !' live games

AI recap

Cloud99p · hackathon submission

THE PROBLEM

Remote meetings are passive.

Attendees multitask, retention drops, and by the next day nobody remembers what was actually said. Recording tools capture the call — but do nothing to keep people engaged during it.

1

multitask

People multitask during video calls — screens lose the fight for attention.

2

no recall

By the next day, most meeting details are gone.

3

scrubbing

"Summarizing" a recording still means scrubbing a video.

THE SOLUTION

Games born from the live transcript — in real time.

MeetPlay is a functional, deployed video-meeting app. As people talk, it turns their words into opt-in attention games and an AI recap. Play = pay attention.

Engage during

Opt-in games that are a natural byproduct of listening — never a distraction. AI recap quiz, speaker stats, leaderboard, and a full searchable

Privacy first

Transcription is opt-in per meeting; transcripts are deleted when it ends.

THE GAMES

Six attention games + stats + recap

Who Said That?

Quote from the meeting — guess the speaker

Meeting Scrabble

Spell words you actually said from scrambled tiles

Word Count Bet

+ Flash — bet how many times a word gets said

Member Word Bets

Anyone opens a bet mid-meeting

Buzzword Bingo

Mark your card as buzzwords get said

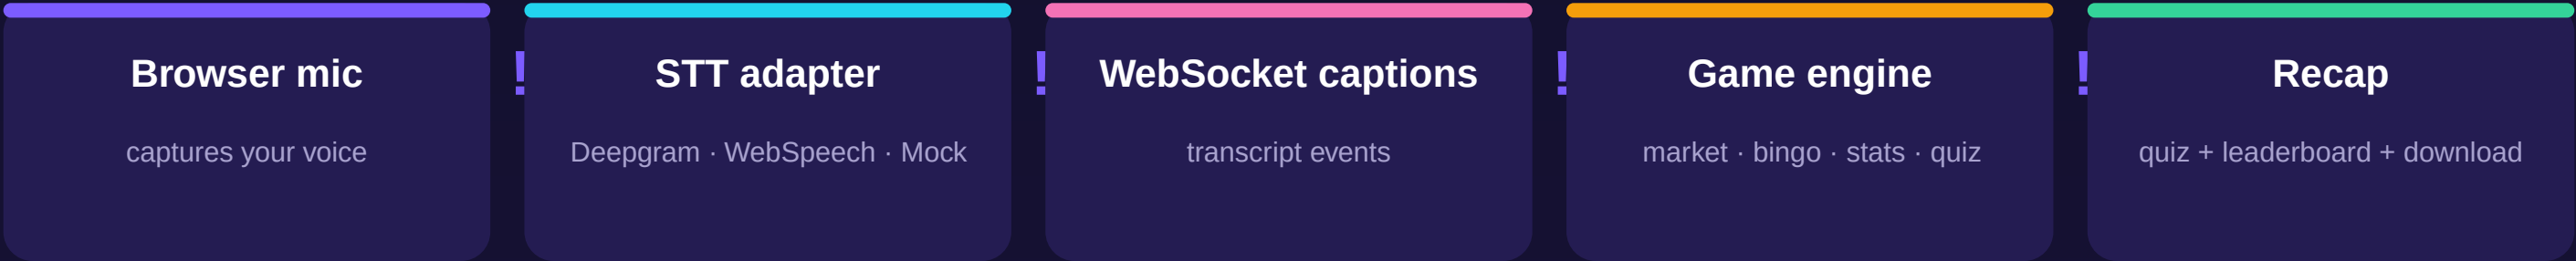

Recap + Stats

Leaderboard, speaker stats, recap quiz

Player-chosen games — no random popups. Only Flash WCB is automatic, so nobody juggles four timers at once.

HOW IT WORKS

Spoken word !' live games !' recap

Omnilearn knowledge graph

One knowledge layer, many products.
Stores quotes + meeting intelligence for
Who-Said-That and the recap quiz.
Batched, idempotent, fire-and-forget; falls
back to an in-memory buffer if unreachable.
Privacy-purged when the meeting ends.

LiveKit Cloud media

Open-source SFU (Selective Forwarding Unit)
scales to 20–50+ participants.
Real-time audio/video + screen share.
LiveKit handles media only — games run
over the same WebSocket as chat +
captions.
Degrades to text mode if media is down.

TECH STACK

A pragmatic, real-time web stack

Frontend

Vite + React + React Router

Backend

Fastify (serves SPA + REST)

Realtime

WebSocket hub for chat, captions, games

Media

LiveKit Cloud (WebRTC SFU)

Speech-to-text

Deepgram (nova-2 / flux) via server proxy

Meeting intelligence

Omnilearn knowledge-graph SDK

Hosting

Railway — meetplay-production.up.railway.app

Data

Postgres / in-memory DB (dev default)

LIVE TRANSCRIPT PIPELINE

One STTAdapter contract, three backends

Every adapter emits the same shape — { speakerId, text, isFinal, timestamp, confidence } — so captions and games work identically in every mode. The key never ships to the browser.

MockAdapter zero config, deterministic script, synthetic speakers	Demos · zero-config local dev
WebSpeechAdapter free browser-native STT, single speaker	Free captions (no diarization)
DeepgramAdapter streaming + diarized via /api/stt server proxy; nova-2 = diarized multi-speaker (Who-Said-That), flux = ultra-low-latency turn-based	Production · powers all games

Server-side proxy: browser mic !' your server !' Deepgram. The API key stays on the server.

Deepgram cold start can take ~13s on a fresh session — the server buffers audio until the upstream opens, so real calls self-heal.

MEETING INTELLIGENCE

Omnilearn knowledge graph

Omnilearn is one knowledge layer that powers many products. MeetPlay records each utterance into the graph and reads it back for Who-Said-That quotes and the recap quiz.

One graph, many products

The same meeting intelligence layer is reused across the whole Cloud99p ecosystem.

Quotes stored, answers served

Speakers, content words, and timing feed Who-Said-That and the auto-generated recap quiz.

Privacy purge on meeting end

Transcripts and quotes are removed when the meeting ends — opt-in consent, private by default.

Published SDK

Delivered as @cloud99p/omnilearn-sdk for clean, reusable integration.

RESILIENCE & PRODUCTION-READINESS

Built to survive real calls

STT keepalives + watchdog + auto-reconnect

Idle sessions stay alive; dead / half-open connections are detected and restarted with backoff.

LiveKit retry / reconnect

IPv4-aware TCP probe reports availability; the app degrades to text mode (chat + games) if media is down.

Security audit

5 vulns found & fixed: recap/messages auth, password lockout (5 !' 15-min block), production JWT guard, locked-down CORS, 24h cleanup job.

Production key guard

No secrets in the repo; the server refuses to boot in production without JWT_SECRET; STT key stays server-side.

1080p recording simulcast

LiveKit Egress MP4 the user can't see internally — a hidden robustness layer.

LIVE DEMO

Try it right now

- 1

Create a room

Share the join link.
- 2

Enable captions & games

Consent banner !' live captions stream.
- 3

Just talk

Watch bet markets open and Flash WCB pop up.
- 4

Pick a game

Who Said That, Scrabble, Bingo from the menu.
- 5

End the meeting

Recap quiz, leaderboard, full transcript.
- 6

Download .txt

The whole meeting as a document.

WHAT'S NEXT

Roadmap

NEAR-TERM

SSE live feed

- Real-time updates without a WebSocket handshake for lighter clients.

TF-IDF word suggestion

- Smarter word-choice for Word Count bets from the transcript.

Omnilearn on Railway

- Deploy the knowledge graph alongside MeetPlay for a fully managed stack.

More game types

- New attention games on top of the same live-transcript engine.
